.First, I checked the already installed Java version in my Ubuntu system using the terminal commands java --version and javac --version. It showed that OpenJDK 21 was installed.

.Next, I checked the installed Java folders in the system using the command ls /usr/lib/jvm. It showed only Java 21 versions and no Java 26.

.After that, I downloaded the OpenJDK 26 setup file named jdk-26_linux-x64_bin.tar.gz and saved it in the Downloads folder.

.Then, I created a directory for Java installation inside the system path /usr/lib/jvm using the command sudo mkdir -p /usr/lib/jvm.

.After creating the directory, I extracted the downloaded JDK 26 file into this folder using the command sudo tar -xvzf jdk-26_linux-x64_bin.tar.gz -C /usr/lib/jvm/.

.Once extraction was completed, I verified it by listing the /usr/lib/jvm directory again and found the folder jdk-26.0.1, which confirmed successful installation.

.Next, I registered Java 26 in the system using the update-alternatives command for both java and javac.

.After registering, I selected Java 26 as the default version using sudo update-alternatives --config java and sudo update-alternatives --config javac.

.Finally, I checked the installation using java --version and javac --version, and it showed version 26 for both.

.Thus, OpenJDK 26 was successfully installed and configured on the Ubuntu system.
